

Harness Your Internet Activity

# DNS-Based DDoS Evolving Threat

UKNOF Sept 2015  
Manchester, UK

Ralf Weber

# Nominum Research

- 2 Terabytes of data analyzed per day
  - Anonymized from ISPs worldwide
  - Estimate about 3% of ISP DNS resolver traffic
- Team of data scientists
- Algorithms searching for:
  - DDoS
  - Bots
  - Malware
  - Machine generated traffic
  - Many other trends

# DNS DDoS: Rapid Evolution

**2012** Authorities see surge in DNS amplification

Resolvers see spikes in amplification

**2013** Open Resolver Project reports 30 M open resolvers  
Open DNS proxies in home gateways discovered  
“Purpose built” amplification domains

Random subdomain attacks generate huge spikes

**2014** Attacks targeting popular domains (Alexa 1000).  
Bot-based DNS DDoS malware

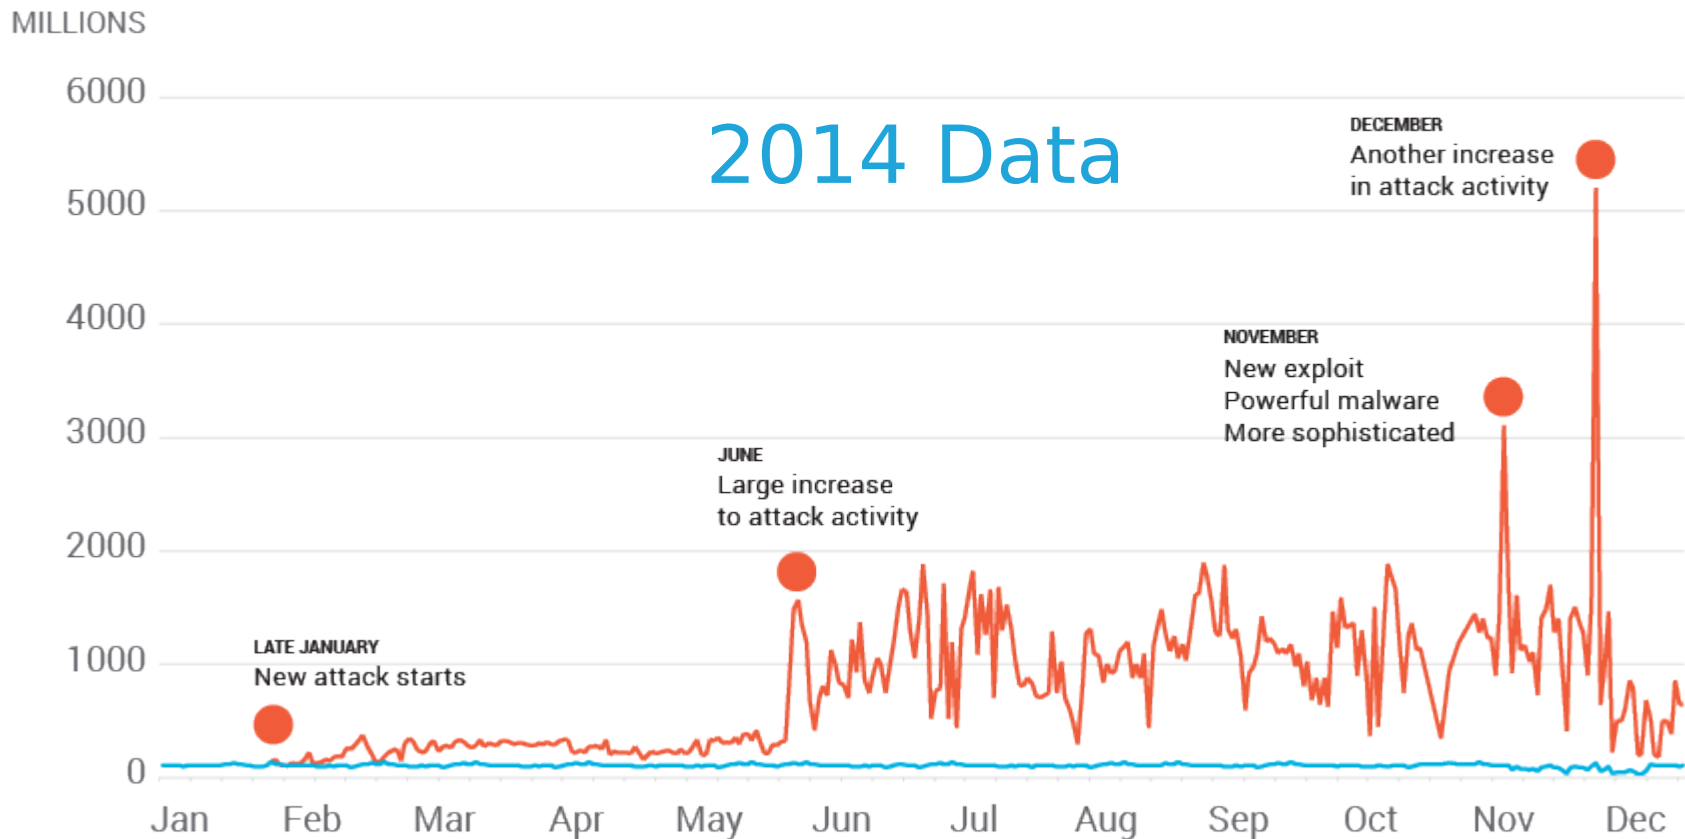

**2015** Attackers refine their exploits - stealth  
New attacks combine randomization & amplification

# 2014 Random Subdomain Attacks

## MILLIONS OF UNIQUE NAMES

■ ATTACK TRAFFIC ■ NORMAL TRAFFIC

DATA REPRESENTS ABOUT 3% OF GLOBAL ISP DNS TRAFFIC

# 2015 Random Subdomain Attack Activity

- No big spikes
- Concentrated attacks – observed as much as 8000QPS from a single IP
  - Identified as a surveillance camera!
- Small number of IPs – 100-200 per attack
  - ~100 IPs took down large network
  
- Attacks seem to be stealthier

# Typical “Day in the Life” DNS Queries Seen at a Resolver

Subdomain

# Typical Day in The Life Random Subdomain Queries Seen at a Resolver

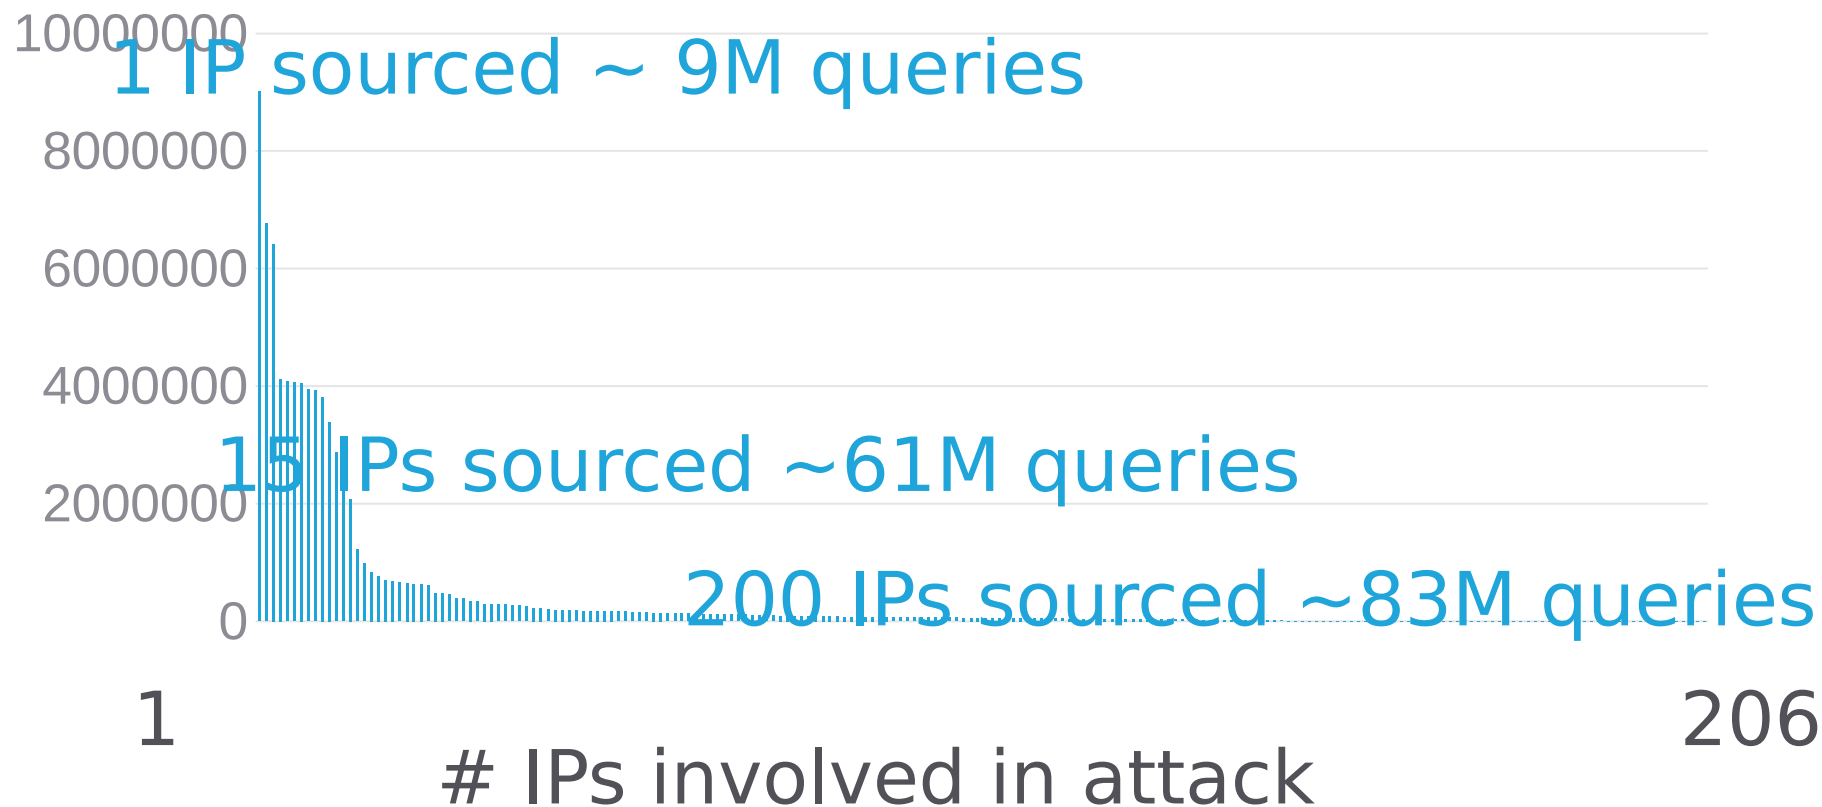

# An Hour in The Life Random Subdomain Queries Seen at a Resolver

# A Few “Things” Generate Intense Attack Traffic

Query Counts from Attacking IPs  
One hours data – APAC provider network

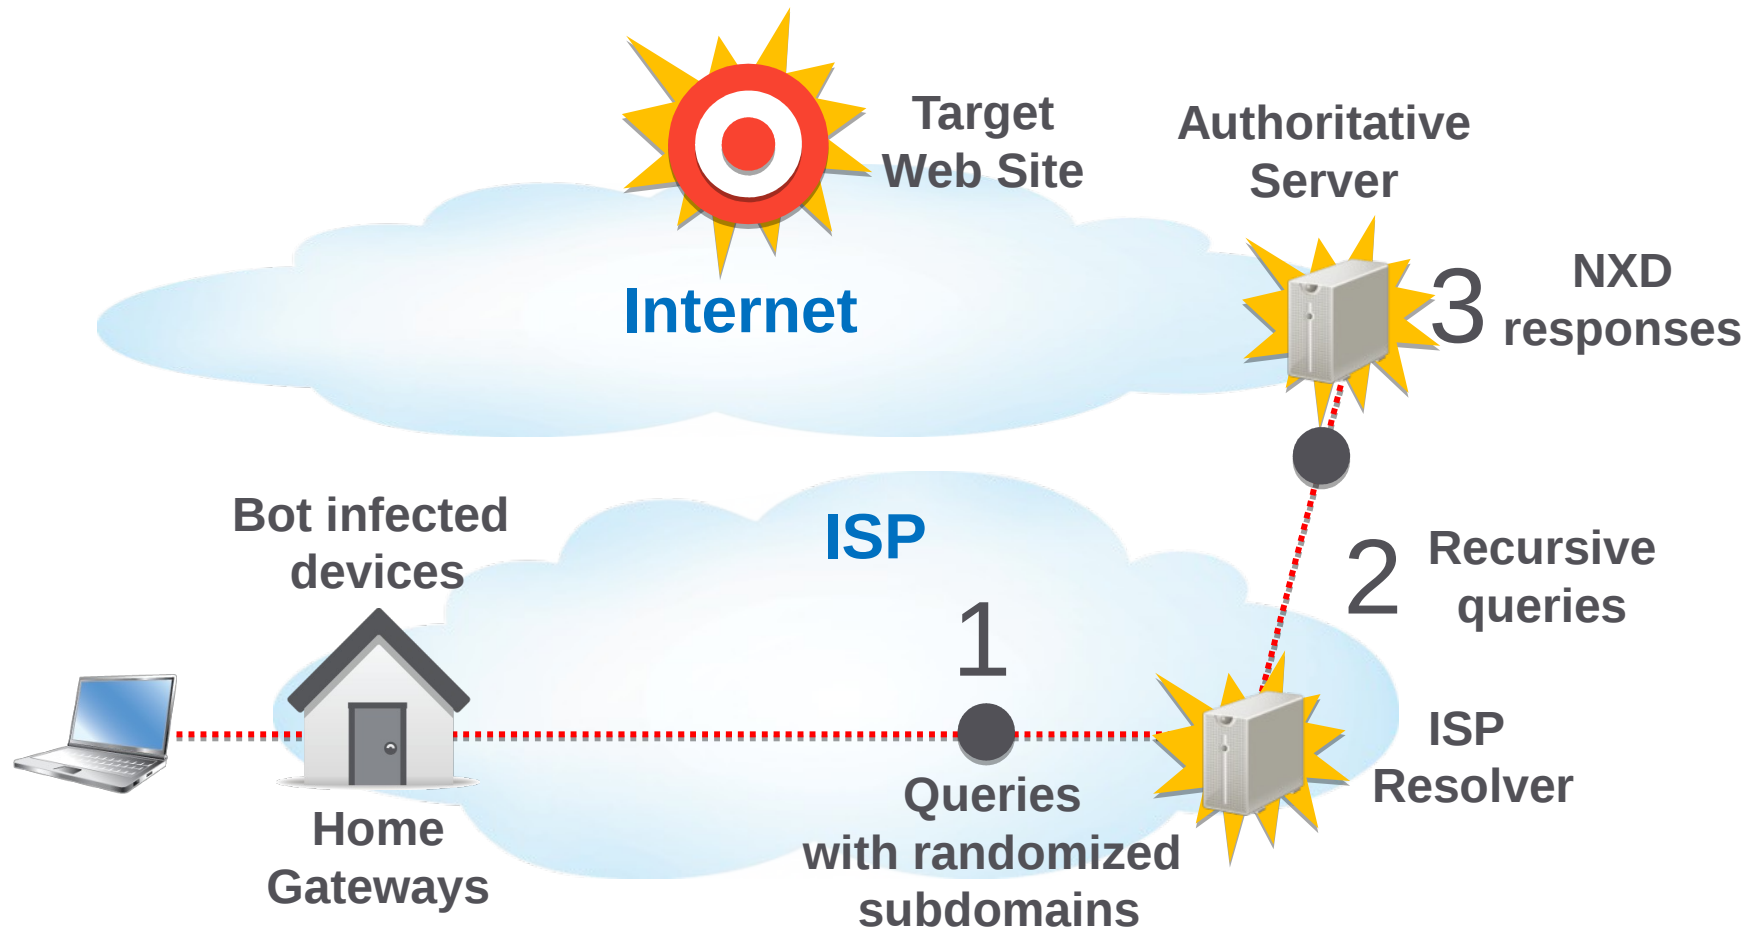

# Diverse Attacks

- 4 major kinds of attacks
  - Early attacks used open DNS proxies in home gateways
  - Latest attacks use bot malware in home gateways and other “Things”
- LOTS of other attack activity out in the long

different Random Label Patterns = Different Attac

# Attacks Using Bots

# What's Happening?

*Network scans for vulnerable devices:  
Home gateways or other "Things"*

*Attempts login with default passwords*

*Most consumer devices use Busybox:  
Many utilities at the attackers disposal  
Load and run malware*

**RouterPasswords.com**

Welcome to the internet's largest and most updated default router passwords database,

Select Router Manufacturer:

BELKIN

## Linux.BackDoor.Fgt.1

**Added to the virus database Dr.Web:** 17/11/2014  
**Description added:** 20/11/2014

Trojan is capable of infecting a variety of devices running on Linux. There are versions for different **Linux.BackDoor.Fgt.1** flavors of Linux, including embedded systems architectures MIPS and SPARC. Designed for DDoS-attacks.

In the initialization process on the infected device **Linux.BackDoor.Fgt.1** gets the current time and the process ID of its own, applies the XOR operation to the obtained values and uses the result as a seed for the random number generator:

```
void __cdecl init_rand(DWORD seed) { DWORD i; // [sp+Ch] [bp-4h]@1 Q[0] = seed; Q[1] = seed - 0x61C88647; Q[2]
```

The Trojan then checks for an Internet connection, referring to one of the servers, Google (8.8.8.8:53). If the connection is able to establish the malware causes of getsockname and ioctl with parameter SIOCGIFHWADDR, thus obtaining the IP and MAC-address of the infected device.

After initialization **Linux.BackDoor.Fgt.1** tries to contact the command server whose address is "sewn up" in the

# Bots Can also Load DDoS Malware And They're Everywhere

| Threat Type  | Query Count    |
|--------------|----------------|
| Spybot       | 1,679,616      |
| Vobfus       | 925,323        |
| <b>Nitol</b> | <b>883,376</b> |
| Gamarue      | 878,672        |
| VBInject     | 864,944        |
| Spambot      | 613,449        |
| Ramnit       | 418,984        |
| Bladabindi   | 90,486         |

| Threat Type    | Query Count   |
|----------------|---------------|
| <b>Dorkbot</b> | <b>52,935</b> |
| Morto          | 35,912        |
| <b>Sality</b>  | <b>35,711</b> |
| <b>Virut</b>   | <b>32,027</b> |
| SMSsend        | 16,000        |
| Jeepf          | 14,645        |
| Gbot           | 11,853        |
| GameOver       | 9,407         |

*Bot queries on a typical day*  
*Bots with loaders in RED*

# Attacks Cause *Many* Problems

- Attacks on popular domains complicate filtering
- Home Gateways mask spoofed source IP
- Bots operate wholly within provider networks
  - Filtering DNS at borders won't work
- Observed tendency for cascading failures
- RRL by authorities increases work for resolvers & authorities
  - This seems to have gone away for now

# Remediation

Traditional approaches are ineffective

- Filtering DNS (port 53) at borders
- In-place DDoS equipment
- Scripts

DNS defenses

- Ingress filtering at resolvers
- Rate limiting queries to authoritative servers

# Testing efficiency of rate limiting

# Setup for testing efficiency

- **Auth Server only** answer a certain rate (e.g 100qps)
- Normal User traffic gets 100% replies
- Insert Attack Traffic
- This will overflow the auth server rate
- Measure good replies

# Challenge: Protecting Good Traffic

Example: Recent attack on Amazon.co.uk

Blocking amazon.co.uk queries won't work!

Blocklists and whitelists are needed

# Protecting Good Traffic

- Whitelist to protect legitimate queries

[www.appledaily.com.tw](http://www.appledaily.com.tw)

[liebiao.800fy.com](http://liebiao.800fy.com)

[www.23us.com](http://www.23us.com)

[wuyangairsoft.com](http://wuyangairsoft.com)

- Blocklist to eliminate malicious traffic

\* [www.appledaily.com.tw](http://www.appledaily.com.tw)

\* [liebiao.800fy.com](http://liebiao.800fy.com)

\* [www.23us.com](http://www.23us.com)

\* [wuyangairsoft.com](http://wuyangairsoft.com)

# Examples

Query: [www.appledaily.com.tw](http://www.appledaily.com.tw).

Answered, protected by whitelist

Query: [avytafkjad.www.appledaily.com.tw](http://avytafkjad.www.appledaily.com.tw).

Blocked by blacklist

Query: [www2.appledaily.com.tw](http://www2.appledaily.com.tw).

Answered through normal resolution

# Summary

- Constant DNS Based DDoS evolution
- Open Home Gateways remain a problem
- Malware-based exploits create broad exposure
  
- Not clear where attacks are headed
- Evidence attackers refining techniques
- Remediation needs to be undertaken with care
